ASP 2030 & 2060

ASP 2030 & 2060 is a high-alloy high-speed steel that contains cobalt (Co). It is manufactured powder-metallurgically using the ASP (AESA STORA Process) process which makes the tools exceptionally resistant to wear. The steel is atomised, compacted and processed to the dimensions required. The result is an extremely homogeneous steel with a unique combination of properties. ASP 2030/60's homogeneous structure enhance such properties as dimensional stability and shape stability during heat treatment, as well as improving grindability and toughness. Toughness is good even for large dimensions and ASP2030/60's method of manufacture and composition mean that it can provide high hot hardness and good wear resistance.

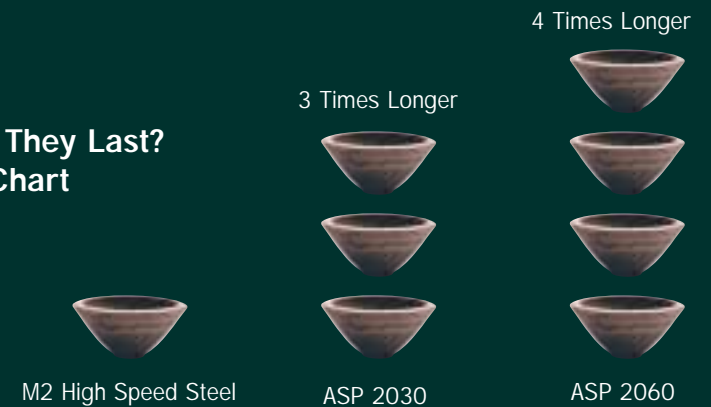

ASP 2030 tools will last approximately 2-3 times longer than ordinary M2 steel and 2060 approximately 3-4 times.

Hamlet's exclusive range of ASP 2030 and 2060 turning tools are now recognised and recommended by many of the worlds top professionals as the best there are. With its ability to hold an edge far longer than conventional M2 HSS and far less regrinding time.

They take woodturning into a new era.
